This chapter is concerned with the Special Theory of Relativity, which dates from 1905. In 1915 Einstein published an additional theory, called the General Theory of Relativity. This latter theory deals with the extension of the Special Theory to the case of the law of gravitation; we shall not discuss the General Theory here.

Feynman also shows that all other variables we can possibly calculate in the S' reference frame, such as the momentum of the charged particle after the force has acted on it for some time all turn out to be what we'd expect them to be according to special relativity.

Magnetism and relativity - Reading Feynman

The general relativity solution for a static homogeneous gravitational field and the special relativity solution for finite acceleration produce identical results. [30] Other calculations have been done for the traveling twin (or for any observer who sometimes accelerates), which do not involve the equivalence principle, and which do not involve any gravitational fields.

Next we discuss the interesting problem of the addition of velocities in relativity. We recall that one of the original puzzles was that light travels at $186,000$ mi/sec in all systems, even when they are in relative motion. This is a special case of the more general problem exemplified by the following.

In 1905, Albert Einstein introduced the Theory of Special Relativity, which said that if the speed of light is constant, then people must experience time differently, which may sound impossible. But Richard Feynman later showed that you can prove it with just lights and mirrors.

Authors usually derive magnetism from electrostatics when special relativity and charge invariance are taken into account. The Feynman Lectures on Physics (vol. 2, ch. 13-6) uses this method to derive the "magnetic" force on a moving charge next to a current-carrying wire. See also Haskell and Landau. However, even with general relativity, element 139 would still have electrons moving faster than light. According to Einstein, this is an impossibility.
